

Sprint Review 2 (Method)

By Malcolm Howard and Fortunato Hernandez

Research Question

How does AI affect player production on the soccer and football fields?

Objective of Sprint Review

- Narrow down our topic: Our first topic was more broad because we just wanted to see how did AI just affected the sport in general but we brought it into one category and that is production.
- Tell the methods we are using

Methods

- Before and After: We will present our data like a before and after base with a graph. We will show how the production of the player has either improved or regressed after AI has been put into play.
- Data Graph: We will present a line graph of the rate of production through the years of players.

Concerns

We do not know what exact stats we are going to use yet, but we have an idea of how to do it. We know that it will involve how the player performs and the changes of their performance after artificial intelligence is implemented.

Next Sprint Review

- We will present the results of the data we collected from the research in forms of graphs.
- We will meet up more so we can discuss the topic than this sprint review.
