How can AI improve the production in football (NFL)?

By Malcolm Howard

Artificial Intelligence

Goals/Benefits

My goal in this project is to find out how much has artificial intelligence helped the football players on the field in their production rate.

Also to see how much has the injury rate changed since artificial intelligence has been used.

This will benefit football players and coaches who want players.

What I Know

I know that artificial intelligence has been helping with the improvement of helmets and shoulder pads throughout the years to prevent less injuries.

Concerns

My biggest concern is being able to know how to set up my data and put it in a good order.

Being able to structure my data for my next sprint review.
